

FOR IMMEDIATE RELEASE

FM Fab releases Joint Jacket for U-Joints in the automotive industry

Hawthorne, CA – March 08, 2013 – [FM Fab](#) is proud to announce the release of their newest product, the Joint Jacket. The Joint Jacket protects Universal Joints for drive shafts and axles. The Joint Jacket is innovative; it is the only product of its type on the market that is currently available.

The Joint Jacket is made from strong, durable polyurethane, and is currently pending a patent for this revolutionary new technology. The Joint Jacket is targeted towards vehicles used for off-roading and 4x4's, but the Joint Jacket can be used by all markets in the automotive industry – both manufacturers and retail companies.

The typical solution for protecting U-Joints is using simple masking or electrical tape. However, these methods aren't effective at protecting U-Joints and can actually cause premature U-Joint cap loss and failure. This well-engineered, semi-universal new product is one size fits most. The Joint Jacket will fit many different U-Joints of many different vehicles.

Although the Joint Jacket is still new, it has received some rave reviews already. Fred said, "Great idea, size 1 fits my 1350's nice and snug. Well-made and great design. I will be back for more..." Jeff added, "What a great product! Works perfect! Thanks!" The stellar feedback on this product is sure to continue to increase as momentum for the new product builds.

The [FM Fab](#) team has a combined experience with fabrication and innovation for well over 20 years. They have been involved in the off-road community for almost 8 years, and the company participates in 4x4 events frequently. FM Fab hopes to offer more, new innovative products and the near future, including their own line of waterjet tabs which will be coming very soon.
